Dear Vneuron Hiring Team,

I am applying for the Java Software R&D Engineer role at Vneuron. I am drawn to Vneuron's work in financial crime compliance, where the software has to be correct, well documented and dependable, and I would like to contribute to Reis RCS as part of your engineering team.

My strongest Java experience comes from two full-stack academic projects. In the Intelligent Medical Application I built a Spring Boot REST backend secured with JWT and role-based access control, and an Angular frontend with AI-assisted symptom analysis and appointment management. In Khotwa, an e-learning platform, I delivered a Spring Boot backend and an Angular interface for managing courses, users and activities. I also work full-stack professionally: at Telnet I built an HR platform on Node.js and MongoDB, integrated three LLaMA/Groq AI agents (a RAG assistant, a CV analyzer and a tool-calling agent) and added JWT auth with role-based access control.

I am comfortable with the working style the role describes. I use AI tools daily for code assistance, refactoring and documentation, work in Agile teams, and enjoy explaining technical decisions clearly. I am honest that my commercial experience so far is short engagements rather than large-scale software publishing, and that my Spring and Angular work is at project scale: I am ready to go deeper into Spring Batch, Spring Integration, Spring Security, Hibernate and PostgreSQL quickly, and I learn fast in a codebase with experienced engineers around me.

I am based in Hammam-Lif, Tunisia, available immediately, and completing my Engineering Degree in Computer Science at ESPRIT in October 2026. I would welcome the chance to discuss how I can contribute to your team.

Sincerely,
Mohamed Yassine Khiari
